

EARTHBOARD TREE-SHELTERS

The whole range of Sirane Earthboard products – including Sirane tree-shelters – are biodegradable.

In many cases this means that the products can meet EN13432 or home composting standards.

However, our Earthboard tree-shelters need to have much longer lifetimes in soil and outdoor environments if they are to be used successfully and do their job.

Although Sirane tree-shelters are biodegradable they are specifically designed to exceed the usual short lifetime set by existing compostability standards.

The lifetime of Sirane tree shelters is at least three years, after which they will break down and ultimately form compost.

They are also recyclable in the paper/card recycling stream.
